

Since its founding in 1983, Information Station Specialists has provided government, industry, nonprofits and individuals specialized radio equipment and services. Operating under the same name and management style throughout its history, the company has produced a record of reliable service in keeping with its lifetime-support promise. Its longevity, stability and experience are unmatched in the industry as evidenced by this list of stations installed across the United States ([theRADIOsource.com/resources/stations-all.htm](http://theRADIOsource.com/resources/stations-all.htm)).

By listening and responding to needs that customers have expressed, Information Station Specialists has challenged conventional theories of equipment configuration and installation, creating offerings that have fostered needed evolution in the field of information station design. For example, the company introduced. . .

- The nation's first portable information radio stations on trailers and in portable cases.
- The first information radio transmitter with a 5000Hz audio bandwidth.
- The first synchronized information stations.
- Broad use of high efficiency AM antennas and unique antenna designs that require minimum surface for ground deployment with hurricane wind tolerance.
- Wireless methods of linking audio to synchronized stations.
- Digital technologies that stream simulcasts of programming to smart devices and PCs.

In 2008 the company founded a national nonprofit, the American Association of Information Radio Operators ([AAIRO.org](http://AAIRO.org)). AAIRO is a coalition of operators from public agencies who manage or support information radio stations. AAIRO has become an avenue for information radio licensees to speak to the Federal Communications Commission as a group about rules and technical improvements.

In addition to its array of specialized radio stations and related equipment, Information Station Specialists continues to provide a broad spectrum of services designed to help people plan, set up and run information stations:

- Onsite project planning.
- Signal propagation studies.
- FCC licensing.
- Full turnkey installation.
- Post-installation signal studies.
- Operation/maintenance training.

This combination of products and services, along with competitive pricing and purchasing options, has made Information Station Specialists the supplier of choice for most of the nation's public safety and health agencies, highway departments, airports, recreation areas, military bases and federal agencies.
